

# Fast triggering eutectic alloys fusible links

Material	Max load	Hole distances	Thickness	Types
Brass or copper	 7.5~16 DaN	 23~46	0.3mm	5EQ, 5EW, 5EK, 5EO
 5EQ	 5EW	 5EK	 5EO	

Made of thin metal, these fusible links have the **shortest response time**, between 2 minutes 50 seconds and 3 minutes, for a temperature rise rate of 20°C/min from 25°C, but the fineness of the metal limits their mechanical strength.

**Material:** Brass (red copper possible on request).

**Surface Protection:** No special surface protection

**ROHS compliance:** These fusible links are available in two versions

- Non-ROHS compliant, using traditional alloys containing lead and cadmium, for temperatures 68°C (155°F); 72°C (162°F); 96°C (205°F); 103°C (218°F); 120°C (248°F).

- ROHS compliant, using ternary alloys based on bismuth, tin and indium, (the high cost of indium makes these models 2 to 3 times more expensive than non-Rohs types) for temperatures 60°C (140°F); 72°C (162°F); 79°C (174°F); 109°C (228°F); 117°C (242°F)

**Identification:** Model, temperature in °C and date of manufacture are stamped on each fusible link

**Tests:**

- Mechanical resistance at ambient temperature: 100% in production
- Trip temperature under static load: by statistical sampling
- Trip time in temperature rise under load according to ISO 10294-4: by statistical sampling.
- Holding load 1h at 60°C or 90°C: compliant and verified by statistical sampling in production (Test according to ISO 10294-4)
- Triggering under minimum load: compliant and verified by statistical sampling in production (Test according to UL33)

**Salt spray resistance:** According to ISO 9227-2012, subjected to a mist formed of 20% by weight of sodium chloride in distilled water, at 35°C for 5 days (120h), the fusible links retain their aptitude for the function, in the response times specified by the standard.

Type	5EQ	5EW	5EK	5EO (Improved mechanical breaking load model)
Welding surface (mm <sup>2</sup> )	175 mm <sup>2</sup>	230 mm <sup>2</sup>	225mm <sup>2</sup>	205mm <sup>2</sup>
Maximum permissible permanent load (DaN)	18 DaN theoretical * but limited to 9 DaN because of the low mechanical breaking load at 25°C **	23 DaN theoretical * but limited to 9 DaN because of the low mechanical breaking load at 25°C **	23 DaN theoretical * but limited to 9 DaN because of the low mechanical breaking load at 25°C **	20 DaN theoretical but limited to 16 DaN because of the low mechanical breaking load at 25°C *
Minimum triggering load	4N	4N	4N	4N
Mechanical breaking load at 25°C for brass fusible links	27 DaN	28 DaN	28 DaN	48 DaN
Mechanical breaking load at 25°C for copper fusible links	26 DaN	27 DaN	26 DaN	46 DaN
Response time according to ISO 10294-4 under maximum load ***	2 min. 55 sec.	2 min. 58 sec.	2 min. 53 sec.	2 min. 53 sec

\* Maximum permanent load depends on alloy composition and ambient temperature on 72°C fusible links. Values are given for guidance only, and for a 72°C non ROHS eutectic alloy. Alloys with temperatures below 72°C and those that are ROHS compliant, generally have a high proportion of Indium, which greatly reduces the mechanical strength.

\*\* The maximum permanent load is limited to 1/3 of the mechanical breaking load at 25°C

\*\*\* Values measured in our own testing equipment. Testing conditions and equipment comply with ISO10294-4 and ISO DIS 21925-1 2017, fig. C1
